In re

Patent Subject Matter Eligibility Guidance

Docket No. PTO-P-2022-0026

**COMMENTS OF
COMPUTER & COMMUNICATIONS INDUSTRY ASSOCIATION**

The Computer & Communications Industry (CCIA)¹ submits the following comments in response to the U.S. Patent and Trademark Office’s September 1, 2022, Request for Comments.²

CCIA is an international, not-for-profit trade association representing a broad cross section of communications and technology firms. For 50 years, CCIA has promoted open markets, open systems, and open networks. CCIA members employ more than 1.6 million workers, invest more than \$100 billion in research and development, and contribute trillions of dollars in productivity to the global economy.

CCIA members are at the forefront of research and development in technological fields such as artificial intelligence and machine learning³, quantum computing⁴, and other computer-related inventions. CCIA members are also active participants in the patent system, holding approximately 5% of all active U.S. patents and significant patent holdings in other jurisdictions such as the EU and China.

I. Summary

When the 2019 Revised Patent Subject Matter Eligibility Guidance was issued for comment, CCIA commented that, while the effort to improve clarity for examiners and applicants was appreciated, significant sections of the Guidance appeared to instruct examiners to ignore case law. In particular, it instructed examiners to ignore consideration of whether claim limitations represent “well-understood, routine, and conventional activity” until after Step 2A, contrary to the Supreme Court’s decisions in *Mayo v. Prometheus* and *Alice v. CLS Bank* where the Court relied on exactly that consideration in determining whether a claim is directed to a law of nature or abstract idea. The Guidance also completely omitted the category of cases in which the Federal Circuit has found that claims directed to “collecting, displaying, and manipulating data” are directed to an abstract idea. Because of this omitted instruction,

¹ A list of CCIA members is available online at <https://www.ccianet.org/members>.

² Submission of Comments Regarding the Patent Subject Matter Eligibility Guidance, 87 Fed. Reg. 53736 (Sept. 1, 2022) (hereinafter “Request”). The Federal Register notice formalized a request originally posted on the USPTO’s web site on July 25, 2022, at <http://www.uspto.gov/blog/director/entry/providing-clear-guidance-on-patent>.

³ USPTO, *Inventing AI*, Fig. 6 (Oct. 2020), <https://www.uspto.gov/sites/default/files/documents/OCE-DH-AI.pdf>.

⁴ See Elliott Mason, *Trends in quantum computing patents* (May 24, 2021), <https://quantumconsortium.org/blog/trends-in-quantum-computing-patents/>.

examiners might read the Guidance’s three categories of abstract ideas as allowing patents on ideas already identified by the Federal Circuit as abstract, leading to the issuance of patents that violate Federal Circuit precedent.

That situation has not changed. The October 2019 Guidance and the MPEP integration did not remedy these issues. While the changes to the MPEP stemming from the 2019 guidance documents may have reduced the number of rejections for subject matter eligibility, it has done so by requiring examiners to issue patents by following a framework that is not in compliance with binding case law from the Supreme Court and the Federal Circuit. As a result, many patents have likely issued that do not meet the legal standard for eligibility. And while these patents might eventually be invalidated in court challenges, their issuance comes at a cost. Before they are invalidated, they can be used to threaten small and medium businesses that can’t afford to defend themselves in court. And even when asserted against businesses with the financial means to defend themselves, the cost of defense results in reduced investment in R&D and employment.⁵ Even the businesses that obtained these patents suffer harms, as they have wasted resources in the expectation of a robust and reliable patent right and received a patent that is not valid.

The unfortunate reality is that none of this was necessary. Innovation continued to thrive in the period between *Alice* and the 2019 guidance updates. *Alice* did not block progress in emerging and critical areas of technology like artificial intelligence, cryptography, network architecture, or advanced semiconductors. CCIA members, who are recognized as leaders in these areas, continue to innovate and can obtain the necessary protections for their innovations. The 2019 guidance updates did not enable them to do so; the updates simply enabled the issuance of patents that should never have been issued, hampering innovation in these crucial areas.

The Office should update the MPEP to incorporate the “data manipulation” case law and remove the instruction to examiners to delay considering conventionality until after Step 2A. These changes will align the MPEP with the instructions of the courts. In turn, they will reduce the number of invalid patents issued, thereby limiting the harm those patents cause.

II. “Collecting, Displaying, and Manipulating Data”

The Guidance lays out three categories of abstract ideas: mathematical concepts, certain methods of organizing human activity, and mental processes.⁶ However, this categorization appears to omit a category of abstract ideas characterized by the Federal Circuit as a “familiar class of claims”⁷—the set of abstract ideas that are directed to “collecting, analyzing, and displaying [] information”⁸ or “collecting, displaying, and manipulating data.”⁹ While the Federal Circuit has made clear that it does not “suggest that every claim involving the collection, organization, manipulation, or display of data is necessarily directed to an abstract idea,”¹⁰ this

⁵ See, e.g., Filippo Mezzanotti, *Roadblock to Innovation: The Role Of Patent Litigation in Corporate R&D*, 67 *Management Science* 7291 (2021).

⁶ 87 Fed. Reg. at 52.

⁷ *Electric Power Group, LLC v. ALSTOM SA*, 830 F.3d 1350 (Fed. Cir. 2016).

⁸ *Interval Licensing LLC v. AOL, Inc.*, 896 F.3d 1335 (Fed. Cir. 2018).

⁹ *Intellectual Ventures I, LLC, v. Capital One Fin. Corp.*, 850 F.3d 1332, 1341 (Fed. Cir. 2017).

¹⁰ *MOVE, Inc. v. Real Estate Alliance*, Case No. 2017-1463, slip op. at 9 (Fed. Cir. Feb. 1, 2018).

familiar class of cases is a significant aspect of the Federal Circuit’s abstract idea jurisprudence and appears not to be explicitly addressed by the Guidance.¹¹

The Guidance instead instructs examiners to determine if a given claim is directed to one of the three explicit categories. Although the *Digitech*¹² case cited in the footnotes to the mathematical concepts section of the Guidance could be read to capture this important class of cases, it is a footnote and there is no explicit discussion of this class of cases. If a given claim does not fall into the three explicit categories, an examiner is directed to only “in rare cases” classify the claim as directed to an abstract idea.

However, the type of claim identified above is not a rare case, but rather a frequently identified form of abstract idea. While the Guidance makes clear that it is not substantive rulemaking and does not overrule case law—nor could it—examiners rely on the instructions promulgated by the Office to direct them in examination. By omitting explicit discussion of this grouping of abstract ideas, the Guidance requires examiners to make the difficult choice between either broadly reading a single footnote to incorporate a class of claims or else ignoring a significant portion of binding case law.

Rather than relying on examiners to recognize that case law requires them to reject this type of abstract idea utilizing the catch-all provision of Section III.C, or the *Digitech* footnote, the Guidance should be updated to summarize and provide examiners with an explicit pathway for rejection of this class of claims.

III. Conventinality and Step 2A

The Guidance requires examiners not to consider conventionalality of claim limitations at Step 2A, when the examiner determines if the claim integrates the abstract idea into a practical application. However, this is not consistent with the Federal Circuit or Supreme Court’s approach to analyzing this question. Both the Federal Circuit and the Supreme Court consider conventionalality as part of the entirety of Step 2, not solely when considering inventive concept as in Step 2B.

Removing conventionalality from the Step 2A analysis for computer-implemented inventions runs the risk of allowing subject matter that is clearly ineligible. For example, the claim in *Two-Way Media* was directed to an abstract idea. That abstract idea was integrated into a practical application—that of streaming audio-visual data to multiple users and tracking the time during which each user receives the streamed data. However, nothing in the claimed invention “require[d] anything other than conventional computer and network components operating according to their ordinary functions” and thus the Federal Circuit found the claim to be ineligible.¹³ Similarly, in *UFRF v. GE*, the Federal Circuit, in applying *Alice* Step 2, considered conventionalality as part of the inquiry into whether the limitations of the claim

¹¹ See, e.g., *Interval Licensing; Electric Power Group; Intellectual Ventures; Univ. of Florida Research Foundation, Inc. v. General Electric*, Case No. 2018-1284, slip op. (Fed. Cir. Feb. 26, 2019); *Two-Way Media Ltd. v. Comcast Cable Commc’ns*, 874 F.3d 1329 (Fed. Cir. 2017); *Smart Systems Innovations v. Chicago Transit Auth.*, 873 F.3d 1364 (Fed. Cir. 2017); *in re TLI Commc’ns*, 823 F.3d 607 (Fed. Cir. 2016); *Content Extraction and Transmission LLC v. Wells Fargo*, 776 F.3d 1343 (Fed. Cir. 2014).

¹² *Digitech Image Techs., LLC v. Elecs. for Imaging, Inc.*, 758 F.3d 1344, 1350 (Fed. Cir. 2014).

¹³ *Two-Way Media*, 874 F.3d at 1339.

transform the abstract idea into significantly more than just the abstract idea.¹⁴ Failure to consider conventionality when examining practical applications runs the risk of allowing claims that will later be found ineligible.

And in cases such as *DDR Holdings* where the claimed invention was found eligible, the Federal Circuit relied on the unconventionality of the ordered combination of the claim limitations to find that the invention related to something more than simply an abstract idea.¹⁵ Lack of consideration of conventionality in Step 2A also runs the risk of judging ineligible claims that might have been found eligible if the conventionality of the ordered combination of claim limitations was examined.

Further, in distinguishing between computer-implemented abstract claims such as those in *Two-Way Media* or *UFRF* and computer-implemented non-abstract claims such as those in *DDR Holdings*, one important factor is determining whether the claim recites an improvement to an area of computer technology. That inquiry requires a comparison of the claim to “routine, conventional, and well-understood” computer technology in order to determine whether the claim represents such an improvement or not.

A failure to consider conventionality as part of this inquiry risks creating errors in determining whether a given claim meets the patentability inquiry set forth in *Alice*: whether “the balance of the claim adds ‘significantly more.’”¹⁶ Conventionality is a key guidepost, though not the sole test, for whether a claim has done so, and should be considered as part of Step 2A’s role in the inquiry into whether the balance of the claim has added significantly more to the abstract idea.

IV. Innovation Thrived After *Alice*, Even Before The Updates

CCIA’s members have not experienced adverse impacts on their research and development efforts from post-*Alice* patent eligibility jurisprudence; on the contrary, the state of eligibility law has actually been positive for their efforts, reducing meritless patent litigation and the presence of blocking patents on basic concepts while still allowing members to obtain meaningful patent protection for their innovations.

The current state of patentable subject matter jurisprudence has been overwhelmingly positive for the patent system. It has resulted in patent applicants improving the quality of their patents, better defining their inventions.¹⁷ It has allowed small and medium entities to defend themselves against overbroad patents such as claims to own the idea of sending shipping notifications.¹⁸ It has shut down patent suits aimed to claim ownership over ideas as broad as “monitoring a preexisting data stream.”¹⁹ In one notable instance, a prolific NPE ultimately agreed to a settlement that bars them from suing any California entity on any of its IP after three

¹⁹ Doug Kramer, “Bye Bye Blackbird”, *The Cloudflare Blog* (Feb. 12, 2018), <https://blog.cloudflare.com/bye-bye-blackbird/>.

of its patents were invalidated based on § 101.²⁰ These are just a few of many examples—the Electronic Frontier Foundation maintains a page collecting stories in which small businesses and individuals were saved from patent litigation by *Alice*.²¹

The current jurisprudence works. Litigation, especially in the arena of non-practicing entities asserting broad and vague software patents, has been generally reduced in cost²² and frequency.²³ This isn't surprising—and it doesn't represent a threat to productive, innovative companies when they need to defend their technology. One review of § 101 cases found that operating companies are less likely to face a verdict of ineligibility than non-practicing entities.²⁴ The same review also found that biotechnology companies are significantly less likely to have their patent adjudicated ineligible.²⁵ Current subject matter eligibility law primarily prevents low-quality and overbroad patents, and it operates primarily in the information technology and business method spaces.

And there is no empirical evidence of any broader adverse impacts from current patent eligibility jurisprudence. Both U.S. and foreign patent application rates show no impact on the perceived value of U.S. intellectual property. U.S.-based R&D continues to climb and there is reason to believe that reversing or limiting § 101 jurisprudence could have a negative impact on U.S. R&D. Venture capital funding data also suggests subject matter eligibility has not impacted the creation of early stage high-growth companies, while patent application data in critical technologies such as artificial intelligence shows that it has not shifted investment out of those areas. The main arena where a reduction in patent activity has been seen is in business method patents, which are of questionable value to begin with. Finally, the evidence that is typically cited as showing impacts from current § 101 jurisprudence is flawed and cannot be relied upon. It contains fatal errors in data analysis and in fact supports the thesis that § 101 is not a significant issue for the U.S. patent system.

A. *Subject Matter Jurisprudence Has Not Harmed International Competitiveness*

Several questions posed in the Request ask for feedback on how the current state of patent eligibility affects the global strength of intellectual property or the U.S. economy.

In analyzing these impacts, it is crucial to remember that U.S. patents are available to applicants from any country in the world—indeed, more than half of U.S. patents issue to foreign applicants. As illustrated in the graph below, taken from USPTO Performance and Accountability Report data, foreign applicants have not been deterred by changes like *Alice* and *Bilski*. Had those cases produced a negative impact on the worldwide perception of the U.S.

²³ Unified Patents, *2020 Patent Dispute Report: Year in Review* (Jan. 1, 2021), <https://www.unifiedpatents.com/insights/2020-patent-dispute-report-year-in-review>. While the Unified Patents report identifies a slight increase in 2020, that is likely due to the combined impacts of Judge Albright's court in Waco and the changes made to IPR over the past few years. The post-2014 decline in litigation is consistent with *Alice* reducing litigation frequency.

²⁴ Mark Lemley & Samantha Zyontz, *Does Alice Target Patent Trolls?*, 18 J. OF EMPIRICAL LEGAL STUDIES 47, 72 (2021).

²⁵ *Id.*

patent system, we would expect to see foreign applicants reduce the rate at which they file U.S. patent applications. However, there is no evidence of an impact on foreign applicants filing for U.S. patents, suggesting that the international perception of the strength of U.S. intellectual property has not been negatively impacted by those decisions.

Patent Applications by Year and Origin

Similarly, the internal U.S. perception of intellectual property does not appear to have been harmed. The flat application rate from U.S. applicants over the past few years precedes the *Alice* decision, suggesting that it is not due to *Alice*, and the post-*Bilski* increase from 2010-2013 suggests that subject matter eligibility jurisprudence is not the cause of the flat trend in U.S.-based applicants. Taken as a whole, the evidence from patent filings suggests that the *Alice* and *Bilski* decisions have not had a negative impact on the strength of U.S. intellectual property.

There is a single law review article that claims that patent eligibility jurisprudence in the U.S. has resulted in a significant number of U.S. applications being rejected while equivalents are granted overseas.²⁶ This article relies on flatly erroneous data. The study claims to identify 1,694 patent applications that were rejected and abandoned “on the ground that they [we]re ineligible for patent protection under § 101” but were granted by the EPO or CNIPA.²⁷ A recent case study reviewed a random sample of 10 percent (170) of these applications.²⁸ That case study found that 24% of reviewed applications had either never faced an eligibility rejection or

²⁷ *Id.* at 942.

²⁸ Abby Rives, *A Brief Case Study in Policy-Relevant Empirical Assessments: The Shortcomings of Counting Patents by Country to Inform Patent Eligibility in the U.S.*, Engine Advocacy (Oct. 12, 2021), <https://tinyurl.com/rivescasestudy>.

had overcome it before abandonment.²⁹ A further 61% were rejected on multiple grounds at the time of abandonment, suggesting that the USPTO located art that other patent agencies did not find or that the foreign claims were significantly different, and certainly rendering the statement that they were abandoned due to eligibility rejections completely inaccurate.³⁰ And many of the applications were abandoned in favor of continuation applications, a number of which have subsequently issued.³¹ Finally, within the random sample, more than 75% of reviewed applications were filed by foreign inventors and/or assignees, further suggesting that eligibility jurisprudence is not negatively affecting U.S. innovators.

Given the consistent increase in applications by both U.S. and foreign inventors, and the lack of any inflection around 2014 for either, there is no reason to think that subject matter eligibility jurisprudence has had a significant impact on the global perception of the strength of a U.S. patent or even of the overall U.S. perception.

B. Subject Matter Eligibility Jurisprudence Helps U.S.-Based R&D

Question 6 asks whether patent eligibility jurisprudence has caused a shift in the site of research and development activities. To the limited extent that it has, it has caused companies to shift research to the United States, not away.

Because a patent is an exclusionary asset, not a right to practice the invention, and because patents can be filed in any jurisdiction regardless of the location in which research was conducted, there is little positive association between patenting and research and development. However, an overly aggressive patent litigation climate can deter research and development. For example, a company that conducts AI research and development in the United States potentially risks having its entire R&D process disrupted and its worldwide profits available for damages for a suit based on a U.S. patent. If AI research and development is conducted overseas, then only U.S. sales would be at risk from a U.S. patent.

As a result, decisions like *Alice* and *Bilski* have had a positive impact on U.S.-based research and development by ensuring that innovators can protect themselves from low-quality patent assertions, while not preventing innovators from obtaining their own patents on meaningful innovations.

C. Venture Capital Data Suggests No Negative Impact From Subject Matter Eligibility

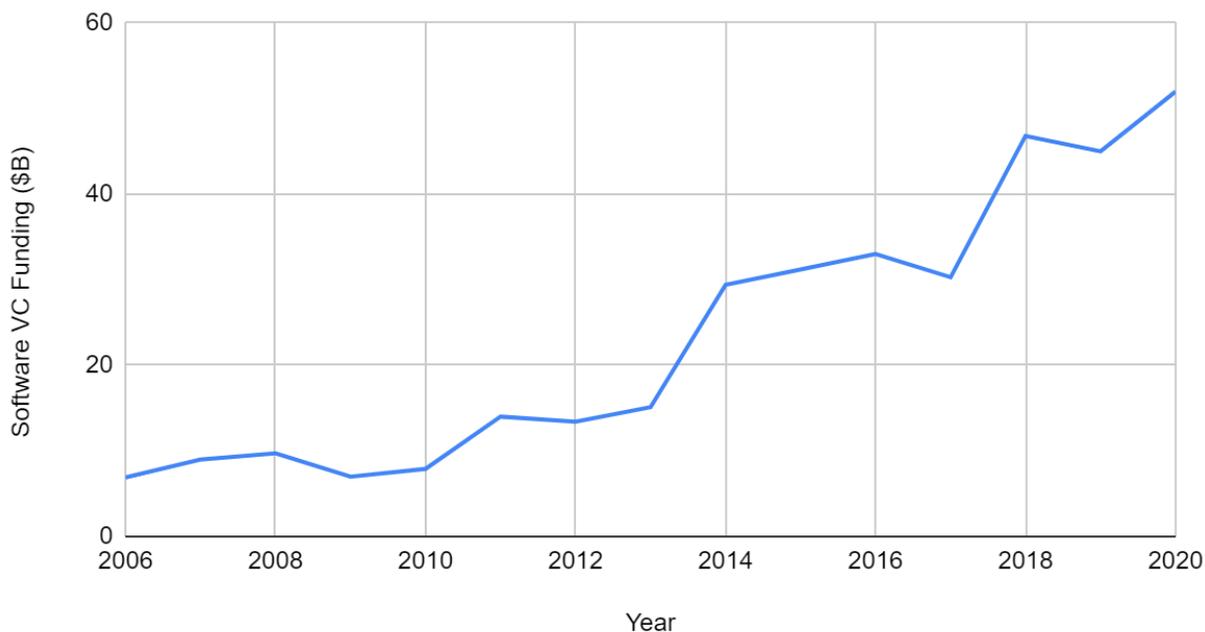

Venture capital represents one way to understand the potential impact of legal changes on early stage high-growth companies. Venture capital data strongly corroborates the conclusion that subject matter eligibility has not negatively impacted funding of venture-stage companies.

²⁹ *Id.*

³⁰ *Id.*

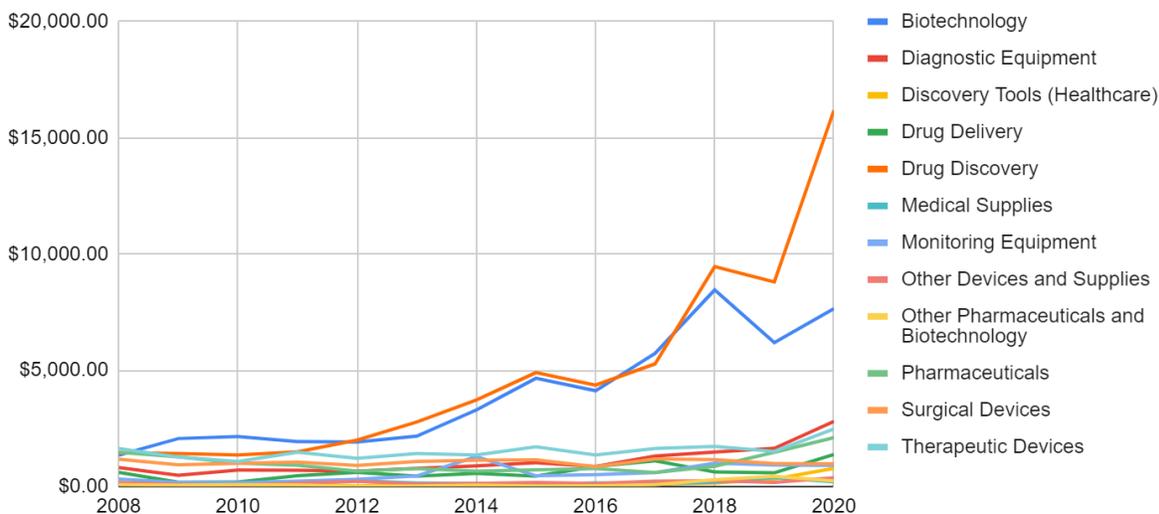

³¹ *Id.* at 2.

VC Funding of Software by Year

For example, data on venture capital deals provided by NVCA/PitchBook shows that investment in the software sector has increased post-*Alice*. Relatively flat investment pre-*Bilski* is replaced by a consistent trend of increase post-*Alice*. This suggests that for venture capitalists interested in software investments, the patent eligibility decisions do not represent a significant headwind preventing investments.

VC Funding by Life Sciences Sector (in millions)

PitchBook also provides a more detailed breakdown within the life sciences sector. Examining life sciences VC data by sector, there is no apparent impact from the *Mayo* and

Myriad decisions. Sectors more likely to have been impacted by those decisions—for example, biotechnology, diagnostic equipment, and drug discovery—have all shown consistent growth after the *Mayo* and *Myriad* cases.

There is one study, conducted by Prof. David Taylor, that suggests that venture capitalists find patentable subject matter jurisprudence to be of concern.³² However, there are numerous flaws in that study. The study relies on voluntary responses, which is likely to bias responses towards those more concerned with patents, especially given that the response rate was approximately 3%.³³ Respondent demographics in the survey support this criticism, with significant over-representation from IT and life sciences as well as early-stage funders compared to the general VC population.³⁴ Even more concerning is the wording of the questions. The questions are directed to respondents who are not experts in patent law, but use the word “patentable” or the phrase “patent eligibility.”³⁵ At the same time, the majority of survey respondents indicated they were not familiar with any of the key patentable subject matter cases.³⁶ And even for respondents who were familiar, the questions using “patent eligibility” preceded the familiarity question³⁷, meaning that these respondents most likely interpreted “patent eligibility” as “the ability to obtain a patent,” not as a reference to patentable subject matter jurisprudence. These problems call into question the results Taylor obtained. But even taking these problems into account, the Taylor study still finds that the majority of respondents have not made changes to their investment decisions due to patentable subject matter jurisprudence.³⁸ In fact, the majority of respondents in the area of construction, software, transportation, communications, and energy technologies indicated they would not change their VC investment behavior if software patents were completely eliminated or would even invest more.

Given the available evidence, there is no reason to believe that the current state of patent eligibility jurisprudence has had an overall negative impact on venture capital investment.

D. Application Class Data Suggests No Evidence For Shifts Out Of Critical Areas

Examining data from application classes that may theoretically be most impacted by patentable subject matter further supports the conclusion that patentable subject matter has not negatively impacted innovation in critical areas such as AI and quantum computing. Instead, its primary impact has been on business method patents.

Prior USPTO research supports this basic conclusion. In a recent study³⁹, the USPTO found that AI patenting experienced a slowdown in the late 2000s, but that after the *Bilski* and *Alice* decisions in 2010 and 2014, AI patenting again increased rapidly. This increase suggests that, at a minimum, these decisions do not appear to have hindered AI innovation and may in fact have accelerated it. Given the importance of AI and machine learning in a variety of areas and the likelihood that restoring the pre-*Alice* patentable subject matter jurisprudence would cause

³⁸ *Id.* at 2112.

³⁹ *Inventing AI* at Fig. 2.

firms to be less willing to invest in AI technologies due to the negative impacts of widespread litigation, the post-*Alice* status quo is worth preserving.

Similarly, quantum computing research has not seen negative impacts from § 101 jurisprudence. A quantum computing landscape report from 2017 showed rapid growth in quantum computing patent applications after 2014⁴⁰; similar reporting from another patent analytics service showed that that growth has only accelerated since 2017.⁴¹ Quantum computing too appears to have only benefited from the Supreme Court's changes to patentable subject matter jurisprudence.

Finally, examining the USPTO's application-level data set to look at impacted art units, there is strong evidence that the primary impact of *Alice* has been to increase rejections of business method patents.⁴² Essentially the entirety of the post-*Alice* increase in rejections occurred in business method art units in Tech Center (TC) 3600. Further examining the data, minor increases in other tech centers such as TC3700 also appear to be primarily related to method patents that relate to specific businesses and are classed into those art units. Examples include rejections in art units such as methods for games (AU3714), educational methods (AU3715), and methods for video game matchmaking (AU3716). Given that business method patents are of questionable origin⁴³ and value⁴⁴, a rule which negatively impacts business methods but positively impacts patent law overall is worth retaining.

In sum, there is no evidence that patentable subject matter jurisprudence has negatively impacted critical emerging technologies like AI and quantum computing. Indeed, the evidence suggests that subject matter eligibility jurisprudence may have helped those areas grow more rapidly than they would have otherwise.

V. Conclusion

Given the known harm from issuing patents that do not comply with § 101 and the lack of any countervailing harms to innovation, the Office should update the MPEP to incorporate the data manipulation case law and to remove the instruction not to examine conventionality until after step 2A of the *Alice/Mayo* two step analysis is complete. To the extent harms are suggested in specific areas, the Office may wish to suggest that Congress and the Administration consider non-patent approaches to incentivize innovation in those arenas. Such approaches might include
